

Hierarchical Bayesian fit pooling across the Bruchovsky cohort — closes WP1 §7.2 limitation #1

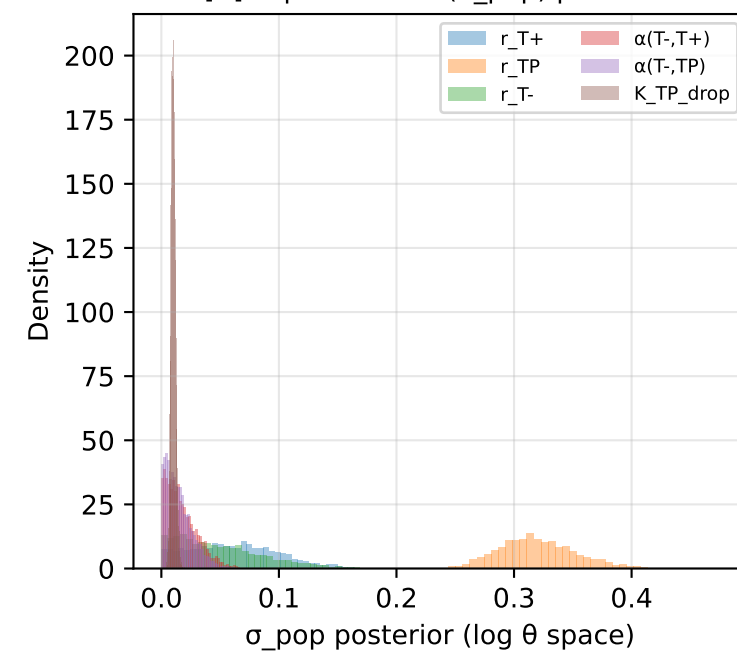

[A] Per-patient posterior means
(71 Bruchovsky patients)

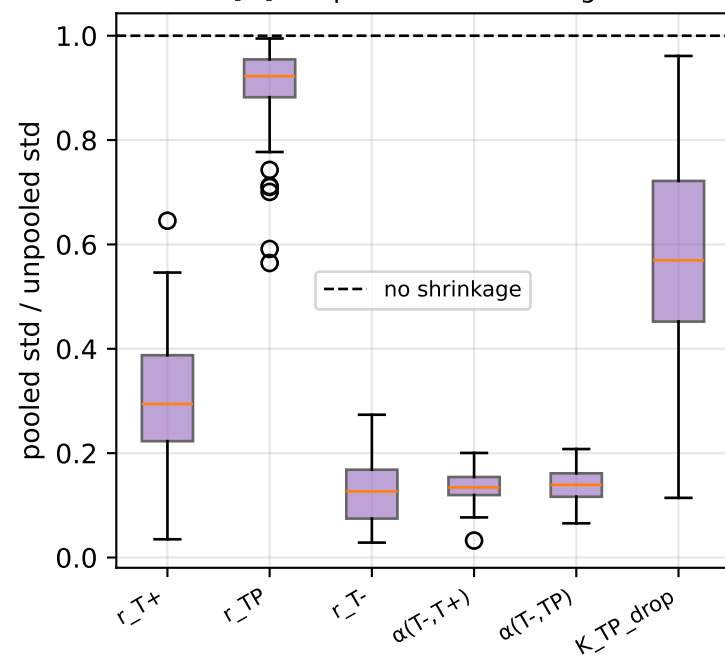

[B] Population mean (μ) posterior

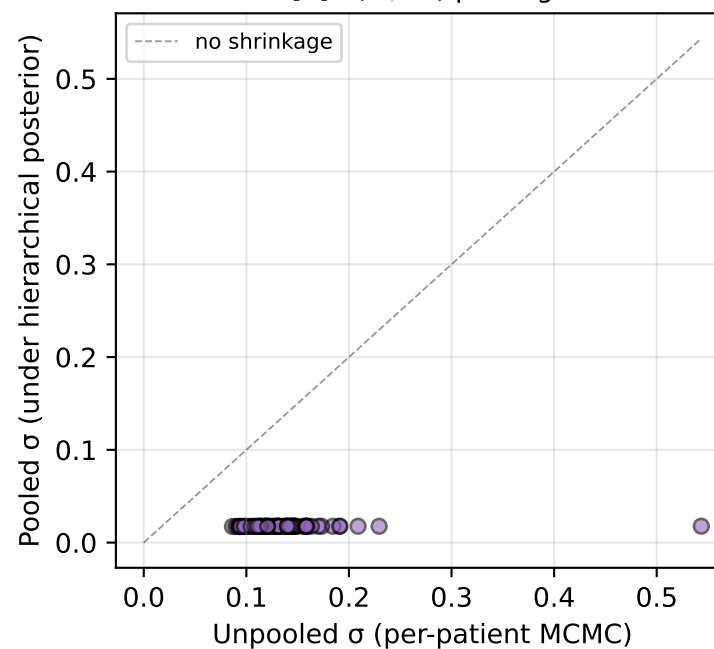

[C] Population SD (σ_{pop}) posterior

[D] Per-parameter shrinkage

[E] $\alpha(T-,T+)$ pooling

HIERARCHICAL BAYES (n=71)

Source: dataTanaka.zip (Bruchovsky)

R-hat (μ): max 1.02
R-hat (σ): max 1.01
Converged: True

Median pooled/unpooled std:

r_{T+}	0.294
r_{TP}	0.922
r_{T-}	0.127
$\alpha(T-,T+)$	0.134
$\alpha(T-,TP)$	0.139
K_{TP_drop}	0.570

A factor < 1 means hierarchical pooling tightened the per-patient posterior on that parameter.
